

ThreatSwitch Benefits to the Enterprise

ThreatSwitch

ThreatSwitch is designed to deliver value across the entire enterprise. As most security executives know, the bulk of time and cost of security is in operations, sales, training, and other activity affecting every single employee and executive. We reduce cost and risk by making security easier for everyone.

For Executives

Measurable Return on Investment

Most of ThreatSwitch's value isn't just for the FSOs; it's for the entire company. On average, ThreatSwitch leads to a 50.7% reduction in training labor, 66.2% reduction in reporting labor, 56.8% reduction in personnel action labor, and reduces cost per employee by \$1k/year. Read the case study that Belcan conducted on their own ThreatSwitch results.

Risk Reduction

Security programs are about protecting your people, assets, customers, and country. We reduce risk by increasing employee participation, consistency of data, and through automatic risk scoring of employees based on a proprietary algorithm.

Higher Proposal Win Rate

The 4th Pillar is here. All federal contracts will require companies to demonstrate security on equal footing with pricing, technical, and past performance criteria. Our customers make ThreatSwitch the centerpiece of their security response in proposals.

Powerful Analytics

Enterprise executives and decisionmakers need to allocate thousands of people across programs, rapidly identify compliance gaps, and visualize security risks. ThreatSwitch's powerful analytics feature generates highly flexible reports to easily identify trends within your data and assist in informing critical decisions.

For Employees

Ease of Use

We believe security software should be easy. No matter what, all your employees must complete routine security tasks; ThreatSwitch makes it far easier for them to do it. Because everyone in the company uses ThreatSwitch, it's designed to eliminate the learning curve so that people can get their tasks done efficiently without sifting through around endless emails, screens, and forms.

Cloud-based Accessibility

ThreatSwitch is always where you are. Teams can securely access ThreatSwitch through any Internet connection, knowing that their data is safe and secured.

Collaboration

Employees can collaborate with the security team directly in ThreatSwitch, not via unsecured emails. The security team or other working groups can discuss threats and risks right inside the product, enhancing the record and increasing visibility.

For Human Resources and Compliance

Integration and Interaction with Security

Security regulations often overlap with company policies. Human Resources can monitor reportable information submitted through ThreatSwitch to ensure that employees adhere to corporate guidelines. HR can also provide the insider threat and security team with incidents like misconduct or criminal activity on high-risk employees, all within ThreatSwitch.

Not Just for NISPOM

While many customers buy ThreatSwitch for NISPOM, its training, forms, reporting, and personnel management use cases are equally applicable for compliance and HR challenges like export control, CUI, and NIST.

For Information Technology (IT)

Sharing Information on the Whole Person

NISPOM security and IT security teams are often siloed and struggle to share information on IT-related threats like phishing and other potential breaches. Information reported through ThreatSwitch can be shared with IT to prevent, respond to, or recover from devastating breaches.

Aligning Compliance and Security

As security executives know, compliance doesn't equate to security and security doesn't equate to compliance. ThreatSwitch allows the IT team to share forms, training, policy and guidelines in security compliance channels to make sure that both bases are covered.
